

## The top-10 activities in terms of the difference in time spent on each acitivity of those who have children compared to those without children (minutes)

### The Difference in Time spent on each acitivity of those who have children compared to those without children (minutes)

The top-10 activities in terms of the difference in time spent on each acitivity of those who have children compared to those without children (minutes) across sex. The x-axis represents the time difference (minutes) of those who have at least one household child(ren) (age<18) compared to those who don't have. which having at least one household child(ren) (age<18) makes a difference. The y-axis indicates the name of each activity. The activities are ordered in a descending order from the top such that the activity at the upmost row, i.e., TV (not religious), is the activity with the largest difference. It shows that, for those who have children compared to those who don't, the activity with the largest decrease is watching TV (not religious), whereas the activities with the largest increase are working (for men) and physical care for children (for women).
